

SUSTAINABLE

# BAMBOO RANGE

Bamboo is one of the fastest growing plants in the world, growing up to three feet per day.

The Bamboo is grown in well managed forests which meet social and environmental standards to create highly sustainable plants.

The Bamboo plant naturally needs around a third less water than cotton to grow, and does not need any pesticides, fertilisers or chemicals either, which further enhances its sustainable qualities.

When harvested, the bamboo is dissolved and regenerated into very long staple fibres.

These long Bamboo fibres then provide a wide range of qualities including:

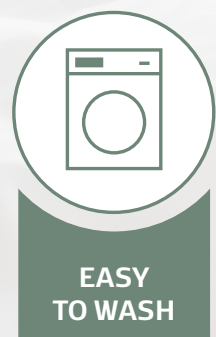

- ⊗ Natural Hypoallergenic and Anti-Bacterial/Anti-Microbial
- ⊗ Thermoregulating to keep cool in the summer and warm in the winter
- ⊗ Breathable due to the hollowness of the fibre. This means it doesn't create mould or smells
- ⊗ Super soft, silk like feel
- ⊗ Highly durable with its high tensile strength
- ⊗ Long lasting and un-susceptible to fraying
